Autonomous Trading Agents

The operating system for automated trading.

Build, deploy and monitor autonomous trading agents across financial markets without writing code.

The Shift

LLMs commoditized trading ideas. Execution is now the bottleneck.

Problem

Most tools are stateless scripts. Markets require persistent memory, adaptation, coordination, and continuous execution.

LiveTape

Build → Deploy → Monitor → Adapt → Repeat.

Stateful Agents

Persistent runtime state enables adaptive behavior beyond traditional bots.

Why Now

AI-generated strategies, prediction markets, and retail automation create demand for execution infrastructure.

Product

Show visual builder, agent dashboard, live trades, and performance.

Technology

Tick data → Memory-mapped buffers → State engine → AST execution → Risk → Broker.

Sub-50ms internal latency, deterministic replay, lock-free pipeline.

Differentiation

Alerts vs autonomous agents; bar-close vs tick execution; stateless vs stateful; code-first vs visual builder.

Market

Retail algo traders, prediction market traders, quant hobbyists, professionals, creators.

Business Model

Community → Starter → Pro → Max.

Go-to-Market

Content, communities, strategy marketplace, broker integrations, prediction markets.

Vision

An operating system for autonomous financial agents.

Why Me

Solo founder who built the production execution engine end-to-end.

Ask

Pre-seed/Seed funding for product, integrations, growth, and hiring.
